

Processing of Scalar Implicatures and the Question Under Discussion

Replication of Degen 2013 Experiment 2a

Research Question

Does the relevance of the stronger alternative to a weak scalar item, manipulated by the implicit QUD, affect the rate of scalar implicatures and the speed of scalar implicature processing?

Hypothesis

When the stronger alternative is more relevant, there are more pragmatic responses and the speed of pragmatic processing is faster.

Task

- Web-based experiment using the gumball paradigm.
- Participants see a gumball machine with different number of gumballs in the upper chamber. After a brief delay, some of the gumballs drop to the lower chamber and participants hear a statement like “You got 5 gumballs” or “You got some gumballs”. Depending on the condition that the participant is assigned to (all QUD, any QUD or no QUD) they see a cover story and are asked to respond by pressing one of two buttons to indicate that yes, they agree with, or no, they disagree with the spoken description.

“You got three gumballs”

- In this experiment, only the critical trials are of interest. In these trials, all 13 gumballs drop to the lower chamber and participants hear “You got some of the gumballs”. The key dependent variables are response type (agree and disagree) and response time.

“You got some of the gumballs”

Stimuli

Quantifier	Set size						Total
	0	2	5	8	11	13	
<i>some</i>	4	1	1	1	1	8	16
<i>alla</i>	2	1	2	1	2	8	16
<i>nunna</i>	5*	1	0	1	0*	1	8
number	3	7 ₆	7 ₃	7 ₅	4 ₂ *	3	31*
Total	13*	10	10	10	7*	20	71*

 incorrect (30)
 correct (33)
 critical trials (8)

*experimenter mistake - needs to change

Participants

- 150 participants from Amazon Mechanical Turk.
- Each participant assigned to one of the three conditions (50 participants in each condition) and reads a cover story that sets up an implicit QUD (relevant QUD or less relevant QUD) or no QUD.

All QUD

Context

You are at a candy store and are testing a row of gumball machines. These are special gumball machines that say how many gumballs you got. However, this report is sometimes faulty.

The store worker tells you that his boss has threatened to fire him if the gumball machines are left empty, and he really needs this job. He cannot see the machines from the register, but he can normally tell how full they are by the machines' statements.

He asks you to tell him if the statement is right or wrong, so that he will know if a machine is empty and needs to be refilled.

Any QUD

Context

You are at a candy store and are testing a row of gumball machines. These are special gumball machines that say how many gumballs you got. However, this report is sometimes faulty.

The store worker tells you that machines sometimes jam and don't deliver any gumballs. His boss has threatened to fire him if the gumball machines stay jammed, and he really needs this job. He cannot see the machines from the register, but he can normally tell if they are working by the machines' statements.

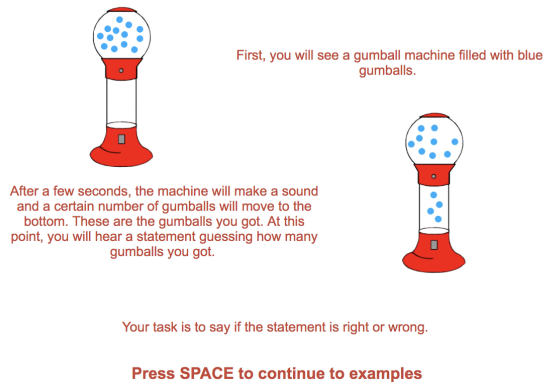

He asks you to tell him if the statement is right or wrong, so that he will know if a machine is empty and needs to be refilled.
